# WINDROCK 6400: BENEFITS OF MACHINERY ANALYSIS

---

**The Windrock 6400 portable analyzer system** is an indispensable tool for compression and combustion machinery reliability programs. It provides fundamental information used to assess the mechanical condition and performance of reciprocating compressors and engines, as well as rotating equipment. The 6400 system also provides early warnings of potentially catastrophic running conditions and gives actionable economic data to support maintenance and operational decision-making.

## ▶ **Monitor Mechanical Condition**

Effective reliability programs depend on accurate evaluation of equipment health. For reciprocating compressors and engines, Windrock 6400 systems are used to assess the mechanical condition of machinery, identifying conditions such as cylinder leakage, worn parts and bearing issues. In addition to manufacturing the tools to monitor equipment health, Windrock provides the expertise to assess current and future conditions. The 6400 analyzer and Windrock MD software use automated diagnostics to give a non-intrusive mechanical evaluation of equipment condition.

## ▶ **In-depth Performance Analysis**

The 6400 system ensures your machines are operating as designed, even when environmental and process conditions change. It evaluates power production/consumption, gas throughput and efficiency and compares actual operation against theoretical models. The 6400 system is commonly used to evaluate control system data, such as power or capacity loading curves, to ensure that actual performance matches the anticipated operational model.

## ▶ **Protection Against Catastrophic Failure**

By evaluating key machinery parameters with every revolution, the 6400 system is able to identify existing machinery deficiencies or operating conditions that may lead to a catastrophic event. In reciprocating machinery, indications of developing malfunctions are often masked within normal operating signals. The 6400 system can precisely distinguish between normal and abnormal to identify developing problems. In addition, the 6400 is able to identify dangerous operating conditions that can progress into malfunctions before the fault develops.

## ▶ **Support Economic Decision-making**

With the Windrock 6400 system, you can measure the efficiency of compressors and drivers to compare the economic return of different types of units across facilities or enterprises. With this information, users can make informed decisions about how to reduce fuel or electricity consumption while maximizing system throughput. The Windrock system also calculates performance degradation due to part wear and malfunctions, such as valve leakage, which can be used as an economic basis for performing repairs.

# TECHNOLOGY OVERVIEW

Windrock 6400 analyzers measure dynamic data relative to crank position and then apply the principles of thermodynamics and science to precisely assess machinery condition and performance. The portable analyzer utilizes multiple sensor technologies to collect data degree-by-degree with respect to crank-angle. Measurement points include in-cylinder pressure, vibration on the frame, crosshead and cylinder, ultrasonic on the valves and injectors, proximity of rod movement and angular velocity of the crankshaft. Using gas laws, equations of state and proprietary diagnostics, Windrock analyzers and software are able to assess the mechanical condition, performance and economic return of reciprocating compressors and engines.

Windrock analyzers also incorporate tools to evaluate rotating equipment. In addition to the crank-angle-based vibration necessary for reciprocating machinery evaluation, Windrock analyzers incorporate the time waveform and FFT tools for evaluation of rotating machinery such as pumps, fans and motors. Advanced features are included to analyze the condition of turbomachinery, either directly or connecting to existing protection systems. All the capabilities of Windrock portable analyzers, as well as Windrock online systems, come together in Windrock MD software. This application automatically makes performance calculations, provides plotting

tools, runs what-if scenarios, automates reporting and gives automatic diagnostics to help the analyst. It also allows users to easily transfer data among colleagues and industry experts for remote analysis. The Windrock approach does not rely on process parameters and apply assumptions about operating conditions. Instead, we measure the internal operating conditions and apply science to make assessments. For this reason, Windrock portable analyzers are the trusted choice for compressor and engine OEMs, equipment packagers, aftermarket parts companies and consulting service organizations to provide unbiased, fact-based analysis.
